Project Overview

The objective of this project was to analyze telemetry data collected from four Daikibo manufacturing facilities during May 2021. Each machine transmitted its operational status every 10 minutes to identify equipment downtime and failures.

Business Problem

1. Which factory experienced the highest machine downtime?

2. Which machine types contributed the most downtime in that factory?

Dataset Information

Source: Daikibo Telemetry Dataset

Format: JSON

Period: May 2021

Factories: Meiyo (Tokyo), Seiko (Osaka), Berlin, Shenzhen.

Tools & Technologies

Tableau Desktop, JSON, Data Visualization, Dashboard Design, KPI Reporting

Calculated Field

IF [Status] = "unhealthy" THEN 10 ELSE 0 END

Dashboard Components

• KPI Cards

• Down Time per Factory

• Down Time per Device Type

• Interactive dashboard filter

Business Insights

The dashboard identifies the factory with the highest downtime and the machine types contributing most to failures, enabling data-driven maintenance decisions.

Skills Demonstrated

Tableau, Calculated Fields, Interactive Dashboards, Data Visualization, Business Intelligence

Conclusion

The solution converts raw telemetry into actionable insights for monitoring factory performance and improving maintenance planning.
